The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human ey in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other extracts, e.g. flavouring or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketablity. CFMs embedded in a gel matrix improve image quality in situations of distorted light species (Diomatrix). The first all-protein 120 GLNFPPNGPVMQKKTQGWEPNTERLFARDGMLIGNNFMALKLEGGGHYLCEFKSTYKARK 180 chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino characteristics to cells in the absence of excitation by extraneous non-white light. 1 SVIAKQMTYKVYMSGTVNGHYFEVBGDGKGKPYEGEQTVRLAVTKGGPLPFAWDILSPQC QYGSIPFTKYPEDIPDYVKQSFPGRYTWERIMNFEDGAVCTVSNDSSIQGNCFIYHVKFS SVIAKQMTYKVYMSGTVNGHYFEVEGDGKGKPYEGEQTVRLAVTKGGPLPFAWDILSPQC QYGSIPFTKYPEDIPDYVKQSFPGRYTWERIMNFEDGAVCTVSNDSSIQGNCFIYHVKFS Gaps Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual Colour facilitating molecule; CFM; green fluorescent protein; GFP; chromophore; biomatrix; transgenic animal; colouring agent; flower industry; expression marker; reporter molecule; photon trap; 0; Length 235; Indels Dove SG; 97.9%; Score 1242; DB 5; 98.3%; Pred. The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or ed coloured lesec. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous

CFMs are useful for producing a transgenic animal which exhibite a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other

light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABB69924.ABP70048 represent CFM related amino acid sequences. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                   0

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

cractors, e.g. flavouring, beverage or juice or colouring agent. Other

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

cation materials that experience UV damage, providing additional

light for growing photocropic organisms e.g. algae and/or corals, for

coding materials that experience UV damage e.g. plastics and car

coding materials that experience UV damage e.g. plastics and car

conting materials that experience UV damage e.g. plastics and car

conting materials from a contemplated uses include,

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

conting maxters, general reporter molecules, photon traps, UV sinks or

conting maxters, general reporter molecules, photon traps, UV sinks or

conting a species, and in fruits and vegetables to enhance their

conting maxters in the species to enhance their

conting the contemplated was Green Fluorescent protein (GPP). The

chromophore to be isolated was Green Fluorescent protein (GPP). The

contemplated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing ocloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional counting materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (blomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The
                                                                                                                                                                                                                                                                                                                                 Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

Comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing oplant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional colight for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their manners. Chromophore to be isolated was Green Fluorescent procein (GFP). The chromophore to be isolated was Green Fluorescent procein (GFP). The

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

consuming the constraint of the care of excitation by extraneous

consuming there is a novel colour e.g. sheep with blue or

ced coloured fleece. They are useful for producing coloured plant

cet coloured letece. They are useful for producing agent. Other

cuses include transducing or intensifying an image, providing additional

constraint phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

cupholstery. CFMs are useful in the flower industry, in the development of

cupholstery cfms are useful in the flower industry, in the development of

coating markers, general reporter molecules, photon traps, UV sinks or

cupholstery. CFMs modify visible colour in edible and/or coramental

constraints of flowering plants. Other contemplated uses include,

constraints and infruits and vegetables to enhance their

constraints of distorted light spectra (biomatrix). The first all-protein

corrected species, and in records ABP69924-ABP70048 represent CFM related amino

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a

```
transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, separate or colouring agent. Other uses include transducing or intensifying an image, providing additional coating materials that experience UV damage e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, compression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental cumples species, and in fruits and vegetables to enhance their carketablity. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GPP). The

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or ced coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing photorropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light species the protein (GFP). The expensent in records ABPS6924-ABP70048 represent CFM emisones flundated was Green Fluorescent protein (GFP). The arise and an organisms of a sequences given in records ABPS6924-ABP70048 represent Protein (GFP). The

acid sequences. (Updated on 06-AUG-2003 to correct OS field.

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

they wanteties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

marketability. CFMs embidded in a gel matrix improve image quality in

struations of distorted light spectra (biomatrix). The first all-protein

chromophore to be isolated was Green Fluorescent CFM related amino
                                                                                                                                                                                                                                                                                                                                                                           Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or exceed coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juuce or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketablity. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (Dimatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              09

The invention relates to an isolated colour-facilitating molecule (CFM)

Comprising a polypeptide which, in a cell, alone or together with one or

Comer enderules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

Companies of the cell of the cell of the cell

when visualised by a human eye in the absence of excitation by extraneous

Companies of the cell of the cell

Companies of the cell of the cell of the producing a coloured plant

Companies of flavouring, beverage or juice or colouring agent. Other

cuses include transducing or intensifying an image, providing additional

Colouring materials that experience UV damage e.g. algae and/or corals, for

Coating materials that experience UV damage e.g. plastics and car

conting materials that experience UV damage e.g. plastics and car

Coating materials that experience UV damage e.g. plastics and car

conting materials that experience UV damage e.g. plastics and car

conting materials markers, general reporter molecules, photon traps, UV sinks or

conting markers, censeal reporter molecules, photon traps, UV sinks or

conting markers, censeal reporter molecules, centering

conting markers, centerials and vegetables to enhance their

conting markers and in fruits and vegetables to enhance their

conting markers and in fruits and vegetables to enhance their

Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 2461, Application US/09540236

Patent No. 6673910

GENERAL INFORMATION:

APPLICANT: Gary L. Breton et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO MORAXELLA CATARF;

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERABEUTICS

FILE REPERBACE: 2709.2005-001

CURRENT APPLICATION NUMBER: US/09/540,236

CURRENT FILING DATE: 2000-04-04
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GENERAL INFORMATION:

J. Biochem. 205:249-256 (1992).
-!- CATALYTIC ACTIVITY: Hydrolysis of terminal, non-reducing:
-!- Inked D-glucose residues with release of D-glucose.
-!- SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
PIR; S21240; S21240.
Hydrolase; Glycosidase.

J. Bacteriol. 173:6844-6848(1991).
-- CATALYTIC ACTIVITY: Isocitrate = succinate + glyoxylate.
-- PATHWAY: Glyoxylate bypass; first step.
-- SUBGNIT: Honcteramer (By similarity).
-- SUBCELLULAR LOCATION: Cytoplasmic.
-- SIMILARITY: Belongs to the isocitrate lyase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21.7%; Score 18; DB 1; Length 15; 75.0%; Pred. Millar A.H., Knorpp C., Leaver C.J., Hill S.A.;
"Plant mitochondrial pyruvate dehydrogenase complex: purification and identification of catalytic components in potato.";
Biochem. J. 334:571-576(1998)
Li FUNCTION: The pyruvate dehydrogenase complex catalyzes the overall conversion of pyruvate to acetyl-CoA and CO(2). It contains multiple copies of three enzymatic components: pyruvate dehydrogenase (E1), dihydrolipoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3).

Submitted (SEP-1998) to Swiss-Prot.
-- SUBCELLULAR LOCATION: Micochondrial (Potential).
-- MISCELLANEOUS: By 2D-PAGE, the determined pl of this protein (spot P2) is: 8.9, its MW is: 25 kDa.
-- SIMILARITY: BELONGS TO THE ESI FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Actinopteryqii, Meopteryqii, Teleostei, Euteleostei, Nocteleostei, Acanthomorpha, Acanthopteryqii, Percomorpha, Perciformes, Scombrodei, Scombridae, Thunnus.

-!- FUNCTION: Lethal neurotoxin, binds and inhibits nicotinic acetylcholina receptors (hACHR).

-!- FUNCTION: Lethal neurotoxin, binds and inhibits nicotinic

acetylcholina receptors (hACHR).

-!- FUNCTION: SECTIVE WW=6236; METHOD=Electrospray.

-!- MASS SPECTROMETRY: WM=6236; METHOD=Electrospray.

-!- MISCELLANBOUS: LD(50) is 0.84 mg/kg by intravenous injection.

-!- SIMILARITY: Belongs to the snake toxin family.

R InterPro: JRN03571; SNake toxin.

R PROSITE; PS00272; SNake TOXIN; PARTIAL.

M TOXIN; Neurotoxin; Postsynaptic neurotoxin;

M Acetylcholine receptor inhibitor; Multigene family.

The N-terminal peptides shown in AAV97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters (both claimed)

```
The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a con-white light or particle emission. CFMs are useful for producing are useful for producing are cast ransgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured flece. They are useful for producing gool or the stands or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of the varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The

```

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

cranspenic animal which exhibits a novel colour e.g. sheep with blue or

cranspenic animal which exhibits a novel colour e.g. sheep with blue or

cranspenic animal which exhibits a novel colour e.g. sheep with blue or

craction and the experience of juice or colouring agent. Other

cases include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

coating materials that experience UV damage e.g. plastics and car

extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their

```
The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the call when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleace. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                             ..
marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a colour-facilitating molecule (CFM)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for
expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein current sequence represents the N-terminal amino acid sequence of a colour-facilitating molecule (CFM)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in siltuations of distorted light spectra (blomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing clause.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous nonwhite light.
                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Colour facilitating molecule; CFM; green fluorescent protein; GFP; chromophore; biomatrix; transgenic animal; colouring agent; flower industry; expression marker; reporter molecule; photon trap; UV sink; sunscreen.
